Figure 6 shows the results of the regression analysis. The dependent variable is the number of days off work due to sickness absence. The independent variables are age, gender, education, income, job tenure, job satisfaction, and job strain. The model explains 18% of the variance in the dependent variable. The results show that older workers have fewer days off work due to sickness absence. Women have more days off work than men. Higher education and higher income are associated with fewer days off work. Job tenure is positively related to sickness absence. Job satisfaction is negatively related to sickness absence, while job strain is positively related to it.
